To whom it may be of concern,

It is a pleasure to recommend Mr. Jubair Ibn Omar Hamza for continued professional and academic advancement. Having supervised Jubair during his internship at OCMS – Textile & Apparel ERP Solution, I witnessed firsthand his contributions to our software development and automation team. He consistently demonstrated a level of technical competence and intellectual maturity that sets him apart from his peers.

From the outset, Jubair demonstrated a strong analytical foundation and an unusual ability to connect theoretical understanding with practical implementation. Our organization develops ERP systems for industrial clients, which requires precision in database design, automation workflows, and data validation processes. Jubair contributed to data analysis tasks using SQL and Python, assisting in optimizing database queries and automating repetitive reporting processes. Rather than merely completing assigned tasks, he consistently sought to understand system architecture and data flow structures before proposing modifications.

One instance that stands out involved a reporting automation task where existing SQL queries were inefficient and caused performance bottlenecks in large dataset environments. Jubair carefully reviewed the query structure, identified redundant joins and indexing issues, and proposed restructuring the logic to improve execution efficiency. After implementation, query runtime was noticeably reduced. What impressed me most was that he did not approach the issue as a narrow coding task; he approached it as a systems-level problem.

Jubair also displayed strong initiative. When assigned routine debugging and data-cleaning responsibilities, he developed small Python scripts to standardize repetitive validation checks. This reduced manual workload for the team and minimized human error. He demonstrated comfort working with structured datasets, relational database systems, and backend logic, reflecting both computational discipline and logical reasoning.

Beyond technical capability, Jubair exhibited professionalism and reliability that exceeded expectations for an intern. He consistently met deadlines, communicated clearly regarding progress updates, and responded constructively to feedback. Notably, Jubair demonstrated natural leadership by taking the initiative to coordinate tasks among fellow interns, ensuring that our collaborative efforts remained synchronized. In team discussions, he articulated technical ideas clearly and respectfully, often acting as a bridge between complex backend logic and practical implementation strategies. His communication style is structured and thoughtful, which makes collaboration efficient.

Importantly, I observed his ability to learn independently. Our ERP environment involves domain-specific industrial terminology and business logic that is unfamiliar to most engineering students. Jubair invested time outside assigned tasks to understand operational workflows of textile production systems so that his technical solutions aligned with practical business needs. This ability to bridge engineering analysis with real-world application is critical for both industry and advanced

academic research.

Although his internship role was industry-oriented, his intellectual curiosity extended beyond immediate deliverables. He frequently asked deeper questions regarding database optimization strategies, software scalability, and system integration constraints. It was evident that he was not simply fulfilling internship requirements but building foundational understanding for long- term growth.

In my experience supervising interns and junior engineers, Jubair ranks among the most disciplined and technically mature individuals I have worked with at this stage of training. He is an excellent collaborator who communicates complex ideas with ease. He has my strongest recommendation.

Sincerely,
Md. Hazrat Ali
Chief Trainer & Research Officer
OCMS – Textile & Apparel ERP Solution
